Project Title : Egypt Business Location Intelligence Platform (EBLIP)

Target Industry: SMEs / Retail Industry

Team Name: I-Titans

Team Members: Mamdouh Faheem – Maram Ibrahim – Mohamed Ayman – Rahma Osama – Sarah Elshenawy

---

1. The Core Problem (The "Why")

Over 60% of SMEs struggle in their first two years due to poor location decisions, lack of accurate market data, and fierce unstudied competition. Entrepreneurs often struggle with fragmented data regarding population density, consumer purchasing power, and fluctuating rental prices in specific Egyptian districts

2. The Solution & Value Proposition (The "What")

EBLIP is an advanced analytics platform that transforms raw data into strategic location insights. By integrating interactive **Power BI** dashboards with detailed **SSRS** reports, the platform provides a "Location Success Score". The single most important benefit is reducing investment risk by replacing guesswork with data-driven AI recommendations.

3. The AI Trinity Strategy (The "How")

LLM (Intelligence): We utilize GPT-4o as a Virtual Business Consultant to interpret complex data patterns from the dashboards and generate natural language summaries for non-technical users.

RAG (Knowledge): The AI "reads" specific Egyptian market datasets, including CAPMAS demographics, Google Maps competitor data, and scraped real estate listings from OLX/Aqarmap, ensuring hyper-local accuracy.

Agents (Action): AI Agents autonomously monitor data updates in the SQL Server. When a high-potential location meets the user's criteria, the agent automatically triggers the generation of a detailed SSRS feasibility report and emails it to the user.

4. Market & Competition

- **Primary User:** Small business owners and franchise planners looking to expand in Egypt.
- **The Advantage :** Unlike simple search engines, our solution provides a multi-layered analytical view combining visual exploration in **Power BI**, structured reporting in **SSRS**, and proactive AI-driven alerts.

5. Execution Plan (High Level)

- **Core Stack:**
  - **Data & Backend:** SQL Server (SSIS for ETL, SSAS for Tabular Modeling).
  - **Reporting & BI:** Power BI Service and SSRS (SQL Server Reporting Services).
  - **AI Framework:** Python (for ML models) and Power AI Agents.
- **Risk Factor:** Ensuring the seamless integration between paginated **SSRS** reports and interactive **Power BI** visuals while maintaining data consistency across multiple local sources.
